

Overview

Portfolio

Content Designer

5 years of experience driving optimizations with AI, user research and localization.

Key projects

- Localized **app store optimization** keyword strategy to increase impressions
- Optimizing **pay-per-click ads** to reduce costs per installs
- Developing no-code **AI tools** to increase team efficiency

Results

- Increased impression and conversion rates by double digits
- Reduced acquisition costs by more than half
- Saved team members 2 hours per naming proposal project

Case 1

Portfolio

Halving CPI by Incorporating Trust Signals

AliExpress Japan PPC Optimization

Role: Content Strategist

Team: User Experience Design

Timeline: FY26 (May–Jun 2025)

Impact: Decreased CPI more than half, improved ROI

Tools: UserTesting.com, Google Ads

Skills: User research, Content Strategy, Cross-Departmental Collaboration, Vendor Management

Summary

- By adding rationale-driven copy and visual trust/safety badges, the AE UED team helped the PPC team reduce Cost Per Install (CPI) by over 50%, directly addressing user demand for credibility and clear value.
- Our strategy significantly lowered CPI, establishing “trust-building” and “value communication” as core pillars of future ad strategy.

AliExpress

153円

1,862円

送料無料・7日お届け・70%OFF・安全に支払い

2,317円

1,973円

Background

- In the previous fiscal year, the PPC team relied on discount-driven ads to drive conversions.
- Data analysis revealed opportunities for ROI optimizations.
- Heavy discounting raised concerns about long-term customer loyalty and sustainable profitability.

Challenges

- AliExpress ads main draw is that they are very discount oriented and less focused on additional benefits users can get
- PPC team aimed to improve ad efficiency to boost user acquisition and retention.
- Project team needed to identify key gaps in current ads that were blocking user trust and engagement.
- Content team faced pressure to respond quickly to business needs while ensuring smooth cross-functional collaboration.

Actions Taken

- User research: Users were shown various ads on different platforms before being asked to grade them on convertibility.
- Major finding: Japanese users responded to trust and safety messaging
- Trust & safety badges: Introduced visual signals like “Factory Direct”, “Top Seller Badge”, and “Verified Supplier”.
- Increased product transparency: Shared origin, manufacturing process, and supply chain details to build credibility.

Before	After
New users get up to 70% off deals	Up to 70% off: items direct from factory

Outcomes

🎯 **CPI reduced by over 50%:** Strategic optimization of ad placement and audience targeting led to a >50% reduction in CPI.

🎯 **Cost savings enabled more efficient resource allocation:** Improved ROI supported scalable, sustainable marketing growth.

Before	After
New users get up to 70% off deals	Up to 70% off: items direct from factory

AliExpress

2,317円

1,973円

Key Takeaways

- ✓ Trust is critical for Japanese users: Credibility is built through clear, transparent product information.
- ✓ Precise value propositions increase engagement: Japanese users respond well to structured, detailed messaging.
- ✓ Cultural context shapes communication: Adapting messaging to local cultural preferences is essential for success.

Driving Discovery Through UI Copy and Category Naming

Role: Content Strategist
Team: User Experience Design
Timeline: FY26 (Aug 2025–Dec 2025)
Impact: Increased L-P GMV & conversion

Tools: ChatGPT
Skills: Product naming, UI/UX writing

Category ID	Current Category Name	Issue Type	Issue Description
101	Pocket 3 Accessories	Capitalization	Relies on product sho
102	Photo Studio Gear	Lack of basic readability	Category is vague and
103	Pocket 3 Mounts		
104	Lighting Kits	Grammar mistake	Does not indicate whe

Summary

- By auditing and rewriting algorithm-generated category names and collaborating across product, localization, and testing teams, the UED team helped improve landing page engagement — turning a broken naming pipeline into a scalable editorial process.
- Replacing truncated, machine-generated labels with clear, user-facing copy improved discoverability and contributed to increased conversion and GMV on targeted landing pages.

Background

- Landing pages only surfaced a waterfall of items with no browsable categories outside of that
- Users would land on a page and bounce if the first results didn't match their intent
- If a user clicked into an item and returned, recommendations remained unchanged — no adaptive discovery

Challenges

- The business team approached UED to name a new channel that would surface contextually relevant categories based on what a user had clicked
- Categories were generated by the algorithm team and often contained truncation, capitalization issues, and grammar errors
- Original page labels were not compelling enough to drive click-through

Actions Taken

- Worked with the algorithm team across multiple rounds of generated category titles until editorial consensus was reached
- Drafted a channel name that captured both personalization (picks) and social proof (trending) — landing on 'Trending picks'
- Collaborated with localization experts, testing, and Product through multiple user acceptance testing sessions prior to launch

Category ID	Current Category Name	Issue Type	Issue Description
101	Pocket 3 Accessories	Capitalization	Relies on product sho
102	Photo Studio Gear	Lack of basic readability	Category is vague and
103	Pocket 3 Mounts		
104	Lighting Kits	Grammar mistake	Does not indicate whe

Outcomes

🎯 **Increase in landing-to-payment GMV:** Users were often more likely to head to payment pages directly, instead of later on

🎯 **Increase in conversion:** Users purchased more often when they landed on these pages

🎯 **Increase in time spent on page:** Users who visited these pages spent more time browsing items, increasing the possibility of purchase

The screenshot displays a mobile application interface for a photography equipment store. The top section features a 'Trending picks' banner with a search icon. Below this, the main category 'Photo Studio kits' is highlighted. The interface is divided into several product listings, each with an image, title, price, discount status, and a shopping cart icon. The products include:

- 1.3L Jewellery Ultrasonic Cleaner:** A box with two dials and a shopping cart icon. Price: \$17.63. Discount: -62% Now. Free shipping.
- Ulanzi MA35 MagSafe Sm...:** A hand holding a camera with a magnetic mount. Price: \$17.63. Discount: -62% Now. Free shipping.
- Pocket 3 Mini Tripod Kit:** A black tripod and camera. Price: \$17.63. Discount: -55% Now. Free shipping.
- ERIKOLE Super Clamp:** A black clamp with a 360° Mini Ball Head. Price: \$17.63. Discount: -67% Now.
- Camera Magic Arm:** A black arm with a Super Clip Bracket. Price: \$17.63. Discount: -74% Now.
- Ulanzi D200 Production Console:** A black console with a screen. Price: \$17.63. Discount: -63% Now.
- BOYA mini:** A small black microphone. Price: \$17.63. Discount: -63% Now.
- Bowens Mount Flash Snoot:** A black snoot with a lens. Price: \$17.63. Discount: -74% Now.
- JJC Upgraded 135 Roll Film:** A roll of film. Price: \$17.63. Discount: -68% Now.

Each product listing includes a '24H' badge indicating fast shipping and a shopping cart icon. The interface is clean and modern, with a focus on high-quality photography equipment.

Key Takeaways

- ✓ Naming is product strategy: A well-named feature shapes how users navigate — copy decisions at this level directly influence engagement metrics.
- ✓ Editorial oversight closes the algorithm gap: Machine-generated labels require human review to meet quality and clarity standards users expect.

Case 3

Portfolio

Increasing GMV with Time-Sensitive Coupon Copy

Role: Content Strategist

Team: User Experience Design

Timeline: FY26 (Dec 2025–Feb 2026)

Impact: Increased GMV

Tools: UserTesting.com

Skills: UX/UI writing, user research

Summary

- By running multilingual preference tests across key markets, the UED team identified that time-sensitive copy drove the highest user intent — informing both the headline and CTA of a new always-on coupon popup.
- Working within Legal constraints and across product and design, the team simplified the discount experience and clarified the redemption flow — contributing to increased GMV and compliant rollout across multiple markets.

Background

- The business team wanted to increase conversion and GMV by offering more interactive landing page experiences
- Users landed on pages featuring a banner with a theme and discount, but had limited opportunity to engage further
- Additional coupons were only available during sale periods — leaving value off the table outside of those windows

Challenges

- The business team approached UED to write copy for animated popups offering coupons outside of active sale periods
- Coupons were exclusive to users on the page, but Legal blocked use of that term — requiring alternative framing
- Discount redemption logic was fragmented (coupons vs. codes), creating user confusion at the point of collection

Actions Taken

- Developed multiple multilingual copy options and launched preference testing across main markets
- Research showed users responded most strongly to time-sensitive messaging — findings fed directly into the final copy direction
- Users also flagged confusion around how discounts were applied — the team worked with designers to extend the toast message with clearer redemption guidance
- Collaborated with Product to consolidate discount logic into a single redemption method, removing the codes vs. coupons ambiguity

Outcomes

- 🎯 **Increase in GMV:** Users who got these coupons made more purchases
- 🎯 **Clearer conversion funnel:** Simplified redemption logic reduced drop-off at the point of coupon collection
- 🎯 **Compliant content in multiple markets:** Legal-approved copy framework rolled out across key regions

Key Takeaways

- ✓ Legal constraints are a creative brief: Being blocked from the obvious word forces sharper copy — time-sensitivity landed harder than 'exclusive' would have.
- ✓ UX writing spans copy and product logic: The confusion wasn't just about words — it was about how the feature worked. Fixing both produced the result.

Case 4
Portfolio

**Optimizing Business Processes Through AI Guidelines
and Usability Testing**

Role: UX Writer / Design Lead

Team: Design

Timeline: H2 2026 (Jul 2026 – September)

Impact: User focused reviews and testing

Tools: Claude Code

Skills: User research, AI workflows

1,200+

strings measured for compliance against company style and Polaris
guidelines

Summary

- By designing workflows for AI and advocating for usability testing, we were able to influence Product process and strengthen our future working models.
- In practice that meant replacing manual AI review on Figma with an AI-native workflow, and giving Design a defined role in how Product gathers user feedback rather than a seat at the edge of the room.

The screenshot displays the 'Tracking AI Native' web application. The main content area is titled 'Shipments' and shows a list of 770 shipments. The interface includes a sidebar with navigation options like Home, Tracking dashboards, Shipments, Orders, Tracking pages, Notifications, Analytics, Order edits, Protection, Apps, ADD-ONS, Monetize, Estimated delivery dates, Green, Tracking App, and Apple Order Tracking. The shipment list table has columns for Tracking number, Carrier, Service, Status, Latest event, Origin, and Destination. The status column uses color-coded labels: 'Exception' (orange), 'Failed attempt' (orange), 'Expired' (orange), 'Out for delivery' (orange), 'Delivered' (green), 'Pending' (orange), and 'In transit' (blue). The table lists various carriers including UPS, USPS, FedEx, and DHL, with their respective services and latest events.

Background

- The Product team sought to give merchants a proactive way to handle all of their exceptions in a single place.
- This also coincided with the business’ goal to run faster by implementing an AI-first mode of working.

Before

After

Challenges

- Rolling deadlines: Due to the newness of the AI-native working process, there were no clear cutoffs or guidelines preventing unapproved changes.
- Business-driven onboarding interviews: Design was merely an attendee to user feedback sessions. This resulted in less balanced feedback after merchants were introduced to feature functionalities.
- Increased workload: AI allowed project teams to create prototypes faster, but they also increased the amount of work that needed to be done by the Design team.

Actions Taken

- Conducted large-scale review: Implemented deterministic processes that measured 1,200+ strings for compliance against company style guidelines and Polaris.
- Optimized how Product gathers user feedback: Created a usability testing plan that let users give feedback more naturally, inviting them to walk through the product as they used it in real time.
- Iterated based on user feedback: Once user interviews were completed, their use cases were mapped out and shared directly to the Product team for consideration.

Outcomes

-  **Beta data validates the usability concern:** Beta customers who opened the Exception Workspace clicked into a detail page, but action coverage was minimal — merchants looked and did not act
-  **Inclusion of usability testing in process:** Following a review of the project’s process, conducting usability testing was included in the team’s process
-  **Optimization of design team specifications:** The Product team has included our single sources of truth in order to prevent errors and reduce workload

Before

Business-led user testing with leading questions

Now

Design-focused usability testing where users can give natural feedback

Before

Specifications for design but no content, and limited use of them in general

Now

Specs now include content, with clear entry points for teams to join the process

Before

Manual AI review comments on Figma, limited capability

Now

AI-native workflows that let us contribute more and handle larger workloads

Key Takeaways

- ✓ Strong infrastructure reduces workload during rolling deadlines: Design-team guidelines, Content-team term bases and documented project decisions let AI move faster and eliminate continual direction iteration from humans.
- ✓ Human feedback grounds the work we do in the physical world: Incorporating user feedback is essential for identifying both internal knowledge gaps and those we encounter via AI.

Influencing Business Naming Conventions

Role: UX Writer
Team: Design
Timeline: July 2026
Impact: Clearer naming conventions

Tools: Google Trends, ChatGPT
Skills: Naming, terminology

Summary

- By advocating for clear and descriptive naming, I helped the Product team alleviate user confusion around a third-party account requirement. The work also influenced Marketing’s subsequent naming methodology for non-branded features.

Before

Ship by AfterShip

×

Enjoy exclusive discounts, get access to 30+ carriers, and save up to 91% on shipping label costs.

30+ carriers

Calculate rates

After

Discounted labels

×

Enjoy exclusive discounts, get access to 30+ carriers, and save up to 91% on shipping label costs.

30+ carriers

Calculate rates

Background

- Users were confused about why saving on shipping and return labels required creating a third-party account, and the feature's UI copy did not explain the connection between the two.
- The naming convention was where the confusion started: it described the third-party relationship rather than the benefit to the user.
- Product reached out for support improving the feature's UI copy, which put the naming decision at the center of the work.

EasyShip labels

Enjoy exclusive discounts, get access to 30+ carriers, and save up to 91% on shipping label costs.

30+ carriers

Calculate rates

Challenges

- Direction was already set: the Product team was committed to copying a competitor’s naming convention, and Legal had already approved its use.
- Internal precedent worked against us: Product Marketing’s own guidelines favored abstract terminology over plain description.
- The window was narrow: concerns had to be raised ahead of final content delivery, which meant making the case quickly and clearly.

Actions Taken

- Raised concerns early: flagged the naming risk with Product, Legal and Marketing ahead of final content delivery, before the copy was locked.
- Proposed evidence-based alternatives: put forward naming options grounded in search trends, product functionality and readability rather than personal preference.
- Led with the user’s perspective: framed the recommendation around the confusion users were already reporting, giving everyone a shared starting point.

Recommendation	Name	Best for	Primary concern
1	Discounted shipping rates	Immediate benefit comprehension and search-language familiarity	Confusion with the rates calculator
2	Discounted shipping labels	Maximum accuracy and task clarity	Generic and less distinctive
3	Shipping label savings	Benefit-led positioning and UI flexibility	Could sound like reporting or analytics

Outcomes

- 🎯 **Adoption of our suggestion:** Product and Legal green-lit Discounted labels, a name that communicated both savings and the product concept
- 🎯 **Change in Marketing strategy:** Subsequent names favored clear, direct, descriptive language for non-branded terminology
- 🎯 **Increased collaboration opportunities:** Click-through rate held average, but the work opened follow-up solutions with Product instead of limiting me to UI copy alone

Discounted labels ×

Enjoy exclusive discounts, get access to 30+ carriers, and save up to 91% on shipping label costs.

30+ carriers

Calculate rates

Key Takeaways

- ✓ Collaboration is key: A product brief is a starting point for collaboration, not a one-way contract. Bringing the user's point of view in early benefits every case.
- ✓ Scope is flexible: It's all of our responsibility to give users the best product, whoever owns the roadmap. Raising concerns early and often is one way to act on that.

Case 6 Portfolio

Automating Naming Proposals to Save 2 Hours Per Project

AliExpress Content Team Cuts Naming Time by 50% Using AI

Role: Content Strategist **Team:**

User Experience Design

Timeline: FY26 (August 2026)

Impact: -50% naming time, +2 hrs saved per project

Tools: ideaLAB, GPT-4, Qwen-3

Skills: AI Workflows, Process Automation, Prompt Engineering, Debugging

Summary

- By building an AI-powered tool to auto-generate brand-aligned product names + rationale, I helped the Content team save 1–2 hours per project — freeing up capacity for strategic work.
- The AI tool delivered immediate time savings, enabling continuous iteration based on user feedback and data — turning naming from a bottleneck into a scalable process.

Background

- AliExpress Content regularly conducts naming proposals for a new products that launch. It is a strategic initiative to improve localization by craft product names that are clear and direct.
- These naming were previously conducted with AI, but occasionally were done manually.
- Increasing the speed with which teammates could complete naming tasks was critical to being able to take on more strategic tasks, like user research.

Challenges

- Tool limitations: Previous tools were not able to access external data like knowledge bases or competitor websites
- Optimized workflow efficiency: Even after tools, naming proposals previously took about 4 hours to complete and format. This could have been improved if AI had better inputs.
- Business needs: UED team faced large demand of requests which prevented them from spending more time on more strategic work.

Previous Naming Tool

Style Guides
Competitor Strategies
Google Search Data

Actions Taken

Created knowledge base: collected best practices and style guides and converted them into a knowledge base for AI.

Developed an AI-powered naming tool with:

- Brand-specific knowledge base & guidelines
- Auto-generated names aligned with brand tone
- Built-in rationale explanations
- Competitor analysis

Optimized naming experience across 3 dimensions:

- Uniqueness & brand fit
- Rationale support

Language	Tone	Style	Keywords	Meaning_Nc	Pronunciati	Spelling_Va
EN	Modern	Minimal	keyword1; ke	Short meanin	pro-NUN-see	variant1; vari
EN	Friendly	Techy	keyword1; ke	Conveys feat	SUF-iks	variant1; vari
EN	Bold	Techy	keyword1; ke	Signals speed	PREE-fiks	variant1; vari
EN	Neutral	N/A	keyword1; ke	Why it works	N/A	N/A
EN	Neutral	N/A	keyword1; ke	Constraint de	N/A	N/A
EN	Neutral	N/A	keyword1; ke	Terms we avc	N/A	N/A
EN	Neutral	N/A	keyword1; ke	Definition of	N/A	N/A

(Example of a knowledge base)

Outcomes

🎯 **1–2 hours saved per project:** Streamlined workflow reduced naming time by 50%.

🎯 **Increased team output:** Freed up capacity allowed team to focus on higher-impact strategic tasks.

🎯 **Improved quality & customer satisfaction:** Consistent, brand-aligned naming boosted user clarity and trust.

New Naming Tool

- Style Guides
- Competitor Strategies
- Google Search Data

Key Takeaways

- ✓ AI automates repetitive tasks: Embedding AI into daily workflows frees teams from low-value labor.
- ✓ Reallocate capacity to strategy: Time saved = bandwidth for innovation and high-impact work.
- ✓ Scale productivity with AI: Systematic use of AI can streamline processes, reduce bottlenecks, and boost efficiency.

Boosting App Visibility Through a Localized Keyword Strategy

Role: Content Strategist

Team: User Experience Design

Timeline: FY25 (Aug 2024–Sep 2024)

Impact: Increased conversions by 45%

Tools: AppTweak

Skills: Localization, Keyword Research, A/B Testing

👍 Relevant keywords helped us gain more visibility

Farklı kategorilerdeki ürünlerinizi keşfederken bütçenizi sarsmadan en iyi fiyatları bulabilirsiniz. Milyonlarca uygun ürün, hızlı ücretsiz kargo ile kapınıza getiriliyor.

Neden AliExpress?

Olmazsa olmaz fırsatlar: Her gün yeni indirimler!

Keyifli alışveriş deneyimi: Kullanıcı dostu arayüz.

Keyword research tool purchased in June 2024

Actions Taken

- Implemented localized keyword integration: Leveraged deep analysis of regional AppTweak data and competitor keyword libraries to craft highly relevant keyword combinations for each market.
- Shifted terminology regionally appropriate expressions: Avoided keyword stuffing and replaced machine translated terms with phrasing aligned with local user habits.
- Focused on high-relevance, low-competition keywords: Prioritized keywords with clear search intent, strong commercial value, and moderate competition levels.

👍 Relevant keywords helped us gain more visibility

Outcomes

🎯 **Increase in Conversion Rate:** By focusing efforts on organic optimization and reducing ad spend, AliExpress was able to get in front of more relevant users, resulting in a **45% increase in conversion rate**.

🎯 **Increase in Impressions:** Overall app store rank increased significantly

🎯 **Substantial cost savings:** Reducing ad spend in Turkey eliminated substantial costs associated with paid downloads, allowing AliExpress to direct resources toward more sustainable growth initiatives.

Key Takeaways

✓ **Localized keywords are the engine driving app store visibility:** Targeting region-specific, highly relevant, and low-competition keyword combinations can substantially boost organic app exposure in target markets.

✓ **Technical fluency is a critical lever for deeper user insights:** A solid understanding of the product's underlying logic enables teams to move beyond surface-level data and uncover true drivers of user behavior.
